Mastering Catia Composites Grid Design: A Comprehensive Tutorial

Ah, composite materials! The lightweight, high-strength heroes of modern engineering. From the sleek curves of an aircraft wing to the robust structure of a Formula 1 car, composites are revolutionizing how we build. And when it comes to designing these intricate, layered wonders, CATIA is often the software of choice. But let's be honest, diving into composite design, especially the nitty-gritty of grid creation, can feel a bit like navigating a labyrinth. That's where this tutorial comes in!

We're going to embark on a journey to demystify the process of CATIA composites grid design. Whether you're a seasoned engineer looking to refine your skills or a curious newcomer dipping your toes into the world of advanced manufacturing, we'll guide you step-by-step. We'll cover everything from understanding the fundamental concepts to executing the practical steps within CATIA V5. So, grab your favorite beverage, settle in, and let's unlock the power of composite grid design together!

Why Grid Design Matters in Composites

Before we jump into the "how," let's quickly touch upon the "why." Why is designing a precise grid so crucial in composite structures? Think of a composite part as a meticulously layered cake. Each layer, or ply, has a specific orientation and material that contributes to the overall strength, stiffness, and behavior of the final component. The grid is essentially the roadmap for laying down these plies.

A well-defined grid ensures:

1. **Accurate Ply Placement:** The grid dictates the boundaries and orientation for each ply, preventing

errors and ensuring the intended material properties are achieved.

2. **Efficient Material Utilization:** By precisely defining ply shapes, you can minimize material waste, which is particularly important for expensive composite materials.
3. **Stress Distribution:** The orientation of plies, guided by the grid, directly influences how stresses are distributed throughout the part. Incorrect grid design can lead to localized stress concentrations and premature failure.
4. **Manufacturing Feasibility:** A clear grid makes the manufacturing process, whether manual or automated, more straightforward and less prone to errors.

Essentially, the grid design is the bedrock upon which a successful composite part is built. Get this right, and you're well on your way to creating a high-performing, reliable composite component.

Getting Started with CATIA Composites Workbench

To begin our CATIA composites grid design tutorial, we first need to access the relevant workbench. In CATIA V5, this is the Composites Design workbench.

If you don't see it readily available, you might need to enable it through your licensing or customize your workbench options.

Accessing the Composites Design Workbench

1. Launch CATIA V5.
2. Go to the **Start** menu.
3. Navigate to **Shape**.
4. Select **Composites Design**.

Once activated, you'll notice a new set of toolbars and icons specifically designed for composite modeling. Take a moment to familiarize yourself with some of the key icons you'll be using: tools for creating surfaces, defining plies, creating patterns, and, of course, our focus today – grid design.

Understanding the Core Concepts of Grid Design in CATIA

Before we dive into the commands, let's understand what we're aiming to create. In CATIA Composites, a grid is essentially a collection of reference elements that define the boundaries and orientation of your composite plies. This typically involves creating

curves or surfaces that act as guides for ply creation. You'll often be working with:

Reference Surfaces

Your composite part will be built upon a reference surface, usually a complex sculpted surface. This is the base geometry that defines the external shape of your component. All ply boundaries will be projected or defined relative to this surface.

Rosettes

A rosette is a fundamental concept in CATIA Composites. It defines a local coordinate system and orientation on a reference surface. Think of it as a compass and ruler placed at a specific point on your surface. Rosettes are crucial for defining ply orientations, especially when you have complex, double-curved surfaces. They allow you to control how the fiber direction aligns with the curvature of the part.

Primary and Secondary References

When creating plies, you'll often need to define their boundaries. These boundaries can be derived from existing curves, projected curves, or even edges of

other surfaces. Understanding how to define these references accurately is key to a successful grid.

Step-by-Step CATIA Composites Grid Design Tutorial

Now, let's get our hands dirty with the practical steps. For this tutorial, let's assume you have a basic reference surface already created – perhaps a simple curved panel.

Step 1: Define Your Reference Surface

Ensure your main part geometry, the reference surface, is active in your CATIA session. This will be the canvas for our composite design.

Step 2: Creating a Rosette

The rosette is central to defining directional information. We'll typically create a rosette on our reference surface.

1. In the Composites Design workbench, look for the **Rosette Creation** tool (often found under the 'Reference Elements' or 'Advanced Surface' toolbars).
2. Select your reference surface as the **Support**.

3. You'll be prompted to define the origin and orientation of the rosette. You can pick a point on the surface for the origin. For the orientation, you can often use existing planes (like XY, YZ, XZ planes) or define custom directions using vectors or lines.
4. For a simple panel, aligning the rosette's primary direction with, say, the X-axis of your model might be a good starting point.
5. Click **OK** to create the rosette. You'll see a visual representation of the rosette on your surface.

Tip: You can create multiple rosettes on different parts of your surface or even on different surfaces to manage complex orientations.

Step 3: Defining Ply Boundaries - The Grid's Foundation

This is where we start building the "grid" in terms of defining where our plies will go. There are several ways to define ply boundaries in CATIA Composites, and the best method depends on your part's geometry and desired outcome.

Method A: Using Existing Curves

If you have curves already defined on or projected

onto your reference surface, you can use them directly.

1. Go to the **Ply Definition** toolbar.
2. Select the **Ply** icon.
3. In the dialog box, select your reference surface.
4. For the **Boundary**, select the curves that define the perimeter of your ply.
5. Crucially, you'll need to associate this ply with a rosette. Select the rosette you created earlier. This tells CATIA how to interpret the fiber direction within this ply.
6. Define the **Material** and **Direction** (which will be driven by the rosette).
7. Click **OK**.

Method B: Using Projected Curves

Often, you'll want to project curves from a sketch or another surface onto your reference surface to define ply boundaries.

1. First, ensure you have the curves you want to project. You might have them in a separate part or sketch.
2. If necessary, use the **Project-On Surface** command (often found in the Part Design or Generative Shape Design workbenches) to project

these curves onto your reference surface.

3. Now, follow the steps in Method A, but use the projected curves as your boundaries.

Method C: Creating Boundaries Directly on the Surface

CATIA also offers tools to create boundaries directly within the Composites Design workbench.

1. Look for tools like **Boundary Creation** or similar. These might allow you to draw curves or create surfaces that act as boundaries.
2. Once your boundary is defined, you can use it when creating a ply as described in Method A.

Step 4: Creating Multiple Plies and Patterns

A typical composite part will have multiple plies, often with varying orientations. This is where the power of CATIA's pattern and array tools comes in handy.

Single Ply Creation: As demonstrated above, you can create plies one by one. This is useful for unique ply shapes or orientations.

Array / Pattern Creation: For plies with repeating

patterns or consistent orientations across a section, you can leverage array features.

1. Create a single ply with its defined boundary and rosette association.
2. Look for the **Pattern** or **Array** tools within the Composites Design workbench.
3. You can often pattern a ply based on a linear, circular, or even a curve-driven pattern. For example, you could pattern a ply along a specific line or curve on your reference surface.
4. When patterning plies, ensure that the rosette association is correctly handled for each instance. Sometimes, you might need to reposition or redefine the rosette for certain patterned plies.

Step 5: Defining Ply Properties (Material, Orientation, Stacking Sequence)

This is where you assign the physical and directional characteristics to your grid-defined plies.

1. When creating or editing a ply, you'll have fields to specify:
 1. **Material:** Select from your defined composite material library (e.g., Carbon Fiber, Fiberglass,

Aramid).

2. **Orientation:** This is often linked to the rosette. You'll define an angle relative to the rosette's primary direction. For example, 0 degrees, 45 degrees, 90 degrees, -45 degrees are common ply angles.
3. **Stacking Sequence:** This refers to the order in which plies are laid up. While the grid design focuses on individual ply boundaries, the stacking sequence defines the overall laminate. You'll typically manage this in a dedicated stacking sequence editor within CATIA Composites.

Advanced Grid Design Techniques

As your composite designs become more complex, you'll encounter situations that require more advanced grid design strategies.

Managing Double-Curvature Surfaces

For complex, double-curved surfaces, the correct placement and orientation of rosettes are paramount. You might need multiple rosettes, each with its own local coordinate system, to accurately represent the fiber direction across the entire surface. Consider

using geodesic paths for defining fiber direction on such surfaces.

Using Reference Planes and Lines

Don't underestimate the power of simple reference planes and lines. They can be used to define origins, axes for rosettes, and even as boundaries for simpler ply shapes.

Creating "Hole" Boundaries

Composite parts often have cutouts or holes. You'll need to define ply boundaries that exclude these areas. This can be done by creating closed curves around the hole and using them as exclusion zones or by defining the main ply boundary and then creating separate "hole" plies that don't overlap.

Automating Grid Design with Macros or Scripts

For repetitive tasks or highly standardized designs, consider exploring CATIA's macro capabilities (VBA, Generative Macros). You can write scripts to automate the creation of rosettes, boundary curves, and even ply definitions based on predefined rules or parameters.

Common Pitfalls and How to Avoid Them

Even with a comprehensive tutorial, there are common traps that can catch designers off guard. Here are a few to watch out for:

Incorrect Rosette Orientation

This is perhaps the most common error. Double-check that your rosette is placed and oriented correctly relative to the surface and the desired fiber direction. A misaligned rosette means misaligned plies, leading to incorrect mechanical properties.

Boundary Definition Errors

Ensure your ply boundaries are closed, valid curves or surfaces. Gaps or overlaps in boundaries can cause issues during ply generation and analysis.

Ignoring Surface Curvature

When creating plies on curved surfaces, the fiber direction needs to follow that curvature. If you're just projecting straight lines onto a curve, you might not be accurately representing the intended fiber orientation. Use the rosette and its directional

capabilities effectively.

Material Definition Issues

Make sure your composite materials are properly defined in CATIA, including their directional properties (e.g., modulus in different directions). An incorrectly defined material will lead to inaccurate simulation results.

Conclusion: Building with Precision

Mastering CATIA composites grid design is a journey, not a destination. It requires a solid understanding of composite mechanics, a keen eye for detail, and proficiency with the software's powerful tools. We've covered the fundamental steps, from creating rosettes to defining ply boundaries and properties. By following this comprehensive tutorial and paying attention to the nuances of grid design, you'll be well-equipped to create robust, efficient, and high-

performing composite structures in CATIA. Happy designing, and may your plies always be perfectly aligned!

Designing lightweight, high-performance composite structures has become a cornerstone of innovation across aerospace, automotive, and marine industries. Among the advanced tools enabling this progress, CATIA's composites grid design functionality stands out as a powerful solution for creating optimized, automated fiber reinforcement patterns. This tutorial explores how to master CATIA composites grid design, offering a comprehensive guide to its core principles, practical applications, and strategic advantages.

Understanding Composites Grid Design in CATIA Composites grid design in CATIA refers to the structured placement of fiber-reinforced layers using predefined grid patterns, enabling engineers

to define material distribution with precision. Unlike conventional manual layup methods, this parametric approach allows for rapid configuration of fiber orientations, thicknesses, and overlap zones across complex 3D geometries. By leveraging CATIA's integrated tools, designers can simulate mechanical behavior early in the development cycle, reducing trial-and-error iterations and accelerating time-to-manufacture. The grid system acts as a digital blueprint, translating engineering

intent into manufacturable detail with minimal user intervention.

The foundation of effective grid design lies in understanding anisotropic material behavior.

Composites derive strength from fiber alignment, and CATIA's grid system enables precise control over fiber angles—typically 0°, 45°, 90°, and cross-ply configurations—across multiple plies. This control ensures that every section of the structure receives optimal load-bearing capacity while minimizing weight, a critical factor in performance-driven industries. Moreover, CATIA supports nested grid

layouts, allowing for variable ply thickness and fiber orientation tailored to localized stress conditions, which enhances structural efficiency without compromising integrity.

Key Insights for Optimal Grid Configuration To harness the full potential of CATIA composites grid design, several best practices should guide the workflow. First, engineers must align grid parameters with the physical constraints of the component, including curvature, load paths, and manufacturing capabilities. For instance, complex contour

surfaces benefit from adaptive grid nesting that follows surface normals, reducing ply misalignment and improving drape during layup. Second, integrating simulation data directly into grid placement enhances structural performance—finite element analysis (FEA) results can inform fiber orientation adjustments in high-stress regions, ensuring balanced strength distribution. Third, maintaining consistency across grid layers is essential; mismatched ply thicknesses or angles can introduce weak

interfaces or warping during curing. CATIA's parametric environment enables real-time updates, ensuring that modifications propagate seamlessly across the entire grid structure.

Another critical insight is the synergy between grid design and automated fiber placement (AFP) systems. By exporting CATIA grid data in industry-standard formats, manufacturers can feed precise fiber layouts directly into AFP machines, minimizing human error and maximizing production efficiency. This integration streamlines the transition from

digital design to physical part, reducing waste and accelerating deployment. Furthermore, CATIA's grid tools support multi-material and hybrid composite configurations, enabling designers to strategically combine carbon, glass, and aramid fibers within a single structure—optimizing cost, weight, and durability based on application-specific demands.

Applications Across Industries

The versatility of CATIA composites grid design makes it indispensable in sectors where performance and efficiency are

paramount. In aerospace, engineers use grid-based composites to fabricate lightweight wing components, fuselage panels, and interior structures that withstand extreme loads while meeting strict fuel efficiency targets. The automotive industry leverages this technology for high-performance chassis, drive shafts, and body panels, where reduced mass directly enhances acceleration and energy economy. In marine engineering, grid-designed hulls and superstructures benefit from enhanced hydrodynamic

performance and resistance to environmental degradation.

Beyond these, the renewable energy sector employs composites grid layouts in wind turbine blades, optimizing stiffness and fatigue resistance to extend service life.

These applications underscore how CATIA's grid design capabilities are not just about technical precision but also about enabling innovation across diverse engineering landscapes. By automating complex fiber routing and integrating multi-physics simulations, designers can push the boundaries of what

composite materials can achieve, unlocking new possibilities in lightweighting and structural optimization.

Economically, optimized material usage reduces waste and lowers raw material costs, particularly critical in high-value composites where fiber content dominates production expenses.

Environmentally, lighter, stronger components contribute to energy savings across transportation and industrial applications,

supporting global sustainability goals. Additionally, the scalability of CATIA's grid tools enables seamless transition from prototype to full-scale production, ensuring that design intent is preserved through every manufacturing phase.

Future Outlook and Emerging Trends Looking ahead, CATIA composites grid design is poised to evolve alongside advancements in artificial intelligence, generative design, and digital twin technologies. AI-driven algorithms are beginning to optimize grid layouts

autonomously, analyzing thousands of load scenarios to propose fiber configurations that balance strength, weight, and manufacturability in ways beyond human intuition. Generative design workflows, when integrated with CATIA's grid system, will enable engineers to define performance targets rather than intermediate steps, allowing the software to generate optimal composite patterns automatically.

Digital twin integration represents another frontier—by mirroring physical composite structures in virtual environments, real-time

monitoring and feedback loops will refine grid performance over time, enabling predictive maintenance and adaptive design updates. As additive manufacturing and automated fiber placement technologies mature, CATIA's grid design capabilities will become even more central, supporting hybrid layup strategies and on-demand production. These innovations promise to deepen the role of composites in next-generation engineering, driving breakthroughs in efficiency, sustainability, and design freedom.

Mastering Catia Composites Grid Design: A Comprehensive Tutorial for Engineers

In the rapidly evolving world of aerospace, automotive, and sporting goods industries, the demand for lightweight, high-strength composite materials is ever-increasing. CATIA V5, a leading-edge 3D CAD software, offers powerful tools for designing and manufacturing these advanced materials. Among its robust features, the Composites Workbench stands out, enabling engineers to intricately design and optimize composite structures. This detailed tutorial will delve deep into the fascinating realm of **Catia composites grid design**, providing a step-by-step guide to creating precise and

efficient composite ply boundaries and definitions.

Understanding **Catia composites grid design** is crucial for anyone involved in composite part development. It's not just about drawing lines; it's about defining the precise orientation and extent of each composite ply, directly impacting the structural integrity, weight, and performance of the final product. This article aims to demystify the process, equipping you with the knowledge and practical steps to effectively utilize CATIA's advanced composite design capabilities.

The Importance of Grid Design in Composite Manufacturing

Before we dive into the technical aspects of **Catia composites grid design**, it's essential to grasp why this stage is so critical. In composite manufacturing, particularly with processes like automated fiber placement (AFP) and automated tape laying (ATL), the precise definition of ply boundaries and their associated grid lines dictates the path of the automated machinery. Any inaccuracies in the grid design can lead to:

1. **Ply Drop-offs and Gaps:** Incorrectly defined boundaries can cause plies to terminate

prematurely or leave unintended gaps, compromising structural integrity.

2. **Material Waste:** Inefficient ply definitions can lead to excessive material usage, increasing manufacturing costs.
3. **Process Inefficiencies:** Misaligned grids can disrupt the automated laying process, leading to slower production cycles and potential rework.
4. **Compromised Performance:** The orientation and coverage of each ply directly influence the mechanical properties of the composite part. Imperfect grid design can result in anisotropic behavior that deviates from the intended design.

Therefore, mastering **Catia composites grid design** is a prerequisite for achieving efficient, cost-effective, and high-performance composite component production.

Getting Started with Catia

Composites Grid Design: Essential Pre-requisites

To embark on your **Catia composites grid design** journey, ensure you have the following prerequisites in place:

Setting Up Your CATIA Environment

First and foremost, you need access to CATIA V5. The Composites Design workbench is typically accessed through specific workbenches. Ensure your user license includes the necessary modules, usually associated with Advanced Machining or specific Composites Design licenses. Once CATIA is launched, navigate to:

Start > Composites Design > Composites Design

This will activate the Composites Design workbench, revealing a specialized set of tools tailored for composite engineering.

Understanding Composite Structures and Terminology

A basic understanding of composite terminology is highly beneficial. Key terms you'll encounter include:

1. **Ply:** A single layer of reinforcing material (e.g., carbon fiber, glass fiber) embedded in a resin matrix.
2. **Laminate:** A stack of multiple plies.
3. **Fiber Direction:** The primary orientation of the reinforcing fibers within a ply.
4. **0-Degree Direction:** Typically defined as the

- primary reference direction for a composite part.
5. **Ply Boundary:** The outline of a single ply on the surface of the composite part.
 6. **Grid Definition:** The set of lines that define the boundaries and orientation of a ply.
 7. **Rosette:** A point on the surface where fiber directions converge or diverge, often used as a reference for defining plies.

Preparing Your Base Surface

The foundation of any composite design is the underlying CAD surface. This surface should be:

1. **Watertight:** Free of gaps or overlaps to avoid errors during ply generation.
2. **Smooth:** Free of sharp creases or discontinuities that could lead to complex ply boundaries.
3. **Well-Defined:** Possessing clear surfaces and features that can be used as references for ply creation.

Often, this base surface is created in the Part Design or Generative Shape Design workbenches. You might also import a surface model from other CAD software.

Step-by-Step Catia Composites Grid Design Tutorial

Now, let's get hands-on with the core of **Catia composites grid design**. We'll walk through a typical workflow, focusing on creating a single ply definition.

Step 1: Creating a Composite Design (RFL) File

Within the Composites Design workbench, the first step is to create a Composite Design document. This is where all your composite-related features will reside.

1. Go to **File > New**.
2. Select **Composite Design** from the list and click **OK**.
3. You will be prompted to select a reference surface for your composite design. Choose your prepared base surface.
4. A new feature, often named "Composite Design.1", will be created, and the Composites Design workbench will become active.

Step 2: Defining the First Ply Boundary

The first ply is often crucial as it sets the initial orientation and defines the starting point for subsequent plies. We will use the "Define Ply" command.

1. In the Composites Design workbench, locate the **Define Ply** icon (often looks like a curved arrow forming a ply shape) and click it.
2. The "Define Ply" dialog box will appear.
3. **Fibers Definition:** This is where you specify the orientation of the fibers. You can choose from various options:
 1. **Direction:** Select a line or edge on your base surface to define the primary fiber direction.
 2. **Rosette:** If your surface has a natural rosette (e.g., a conical or spherical surface), you can select it.
 3. **Absolute Axis System:** Use the global XYZ axis system for orientation.
4. **Boundary Definition:** This defines the extent of the ply. You can select:
 1. **Automatic Boundary:** CATIA will try to automatically determine the boundary based on the fiber direction and any existing features on the surface.

2. **Manual Boundary:** You can manually sketch or select curves to define the ply boundary. This is common for complex shapes.
3. **Select Limit Curves:** Choose specific edges or curves on your base surface to form the boundary.
5. **Location:** Specify whether the ply is on the "Inner" or "Outer" side of the surface.
6. **Name:** Give your ply a descriptive name (e.g., "Ply_0_deg_Inner").
7. Click **OK**.

Step 3: Understanding and Modifying the Grid

Once a ply is defined, CATIA generates a grid that represents the ply boundaries and fiber orientation. This grid is crucial for downstream processes.

Viewing the Grid

The generated ply will have a visual representation on your screen. You can activate the "Show/Hide" command to toggle the visibility of plies and their associated grids.

Modifying Ply Boundaries (Edit Ply)

It's rare that the initial ply definition is perfect. You'll often need to refine the boundaries.

1. Select the ply feature you want to modify in the feature tree.
2. Right-click and choose **Edit Definition**, or double-click the ply feature.
3. The "Define Ply" dialog box will reappear. You can now modify the fiber direction or, more commonly, refine the boundary definition.
4. For manual boundaries, you might need to use tools like **Trim**, **Extend**, or sketch new curves within the context of the ply definition.

Advanced Grid Manipulation

CATIA offers advanced tools for more complex scenarios:

1. **Create Directional Curve:** This command allows you to create curves that dictate fiber paths, especially useful for complex, non-planar surfaces.
2. **Create Plies from Curves:** You can pre-define curves and then use them to generate plies, giving you more control over the ply shape and orientation.

3. **Adjust Ply:** This tool allows you to modify specific aspects of an existing ply, such as its boundary or fiber direction, without redefining the entire ply.
4. **Analyze Ply:** Use analysis tools to check for issues like steepness, curvature, and fiber crossovers, which are critical for manufacturing feasibility.

Step 4: Creating Subsequent Plies and Stacking Sequences

Composite parts are made of multiple plies stacked in a specific order and orientation. This stacking sequence is critical for achieving the desired mechanical properties.

Defining New Plies

Repeat Step 2 to define each subsequent ply. Pay close attention to:

1. **Fiber Orientation:** Each ply will likely have a different fiber orientation (e.g., 0, 90, +45, -45 degrees).
2. **Boundary:** Ensure that the boundaries of new plies complement or overlap existing plies as intended.
3. **Location:** Maintain the correct inner/outer positioning.

Creating the Stacking Sequence

CATIA's Composites Design workbench allows you to define a structured stacking sequence.

1. In the feature tree, right-click on the Composite Design feature (e.g., "Composite Design.1").
2. Select **Insert > Stacking Sequence**.
3. A "Stacking Sequence" dialog box will appear.
4. Drag and drop your defined plies from the feature tree into the stacking sequence.
5. Ensure the plies are in the correct order, from bottom to top (or vice versa, depending on your convention).
6. You can also define repetitive stacking sequences (e.g., [0/90/45/-45]s for a symmetric laminate).

Step 5: Tools for Advanced Composites Grid Design

For complex aerospace or automotive components, you'll need more advanced tools:

Manufacturing Surface Generation

Once the plies are defined, CATIA can generate manufacturing surfaces that represent the actual material that will be laid down. This is crucial for

simulating the manufacturing process.

1. Use the **Generate Manufacturing Surface** command.
2. This command takes your ply definitions and creates distinct surfaces for each ply, accounting for material thickness and curvature.

Ply Drop-off and Definition Tools

CATIA provides specific tools for managing where plies start and end.

1. **Drop Off:** This command allows you to define specific curves or points where a ply should terminate.
2. **Staggering:** For plies that do not cover the entire part, staggering defines how they are arranged to ensure continuous coverage.

Analysis and Verification Tools

Thorough analysis is key to a successful composite design.

1. **Steepness Analysis:** Checks if the fiber direction is too steep relative to the surface curvature, which can be problematic for AFP/ATL.
2. **Curvature Analysis:** Identifies areas of high

curvature where ply draping might be challenging.

3. **Ply Material Properties:** Assign material properties to your plies, enabling structural analysis (e.g., FEA) to be performed on the composite laminate.

Best Practices for Catia Composites Grid Design

To ensure efficient and error-free **Catia composites grid design**, consider these best practices:

1. **Start with a Clean Base Surface:** A well-prepared surface is fundamental.
2. **Use Meaningful Naming Conventions:** Name your plies and features clearly (e.g., Ply_0_deg_Outer_Layer_1).
3. **Define Plies Incrementally:** Don't try to define too many plies at once. Build your laminate ply by ply.
4. **Leverage Existing Geometry:** Use edges, curves, and points on your base surface as references whenever possible.
5. **Regularly Save Your Work:** Composite design can be complex, so frequent saving is essential.
6. **Understand Manufacturing Constraints:** Be aware of the capabilities and limitations of your

chosen manufacturing process (AFP, ATL, hand layup).

7. **Perform Regular Analysis:** Use CATIA's analysis tools to identify and resolve potential manufacturing issues early in the design process.
8. **Collaborate with Manufacturing Engineers:** Ensure your design meets manufacturing requirements by working closely with those who will produce the part.
