Decoding Common Logarithms: A Comprehensive Study Guide and Intervention

Logarithms, often perceived as intimidating mathematical concepts, are fundamental to understanding various scientific and engineering disciplines. This dives deep into common logarithms, providing a detailed study guide, addressing potential difficulties, and offering insightful solutions. We'll explore the core principles, examine practical applications, and equip you with the knowledge and tools to master this essential mathematical concept. **Unveiling the Power of Common Logarithms** Imagine trying to calculate the precise number of atoms in a large object. Or, picturing the magnitude of an earthquake on the Richter scale. These scenarios often involve extremely large or extremely small numbers, making calculations cumbersome and impractical. Common logarithms offer a powerful solution by compressing these vast scales into a more manageable range. This transformation allows us to manipulate these numbers

efficiently. Understanding the Basics of Common Logarithms A

common logarithm, denoted as $\log_{10}(x)$, is the exponent to which 10 must be raised to obtain x . Essentially, it answers the question: "To what power must 10 be raised to equal this number?"

The Relationship Between Exponents and Logarithms

A key understanding lies in the inverse relationship between exponentials and logarithms. If $10^y = x$, then $\log_{10}(x) = y$. This inverse property is the bedrock of applying logarithms to solve exponential problems.

Properties of Common Logarithms

Common logarithms possess several properties that simplify calculations:

- $\log_{10}(1) = 0$: Any number raised to the power of zero is 1.

- **$\log_{10}(10) = 1$** : 10 raised to the power of 1 is 10.

- $\log_{10}(10^x) = x$

This is a direct consequence of the definition.

- **$\log_{10}(a * b) = \log_{10}(a) + \log_{10}(b)$** :

The logarithm of a product is the sum of the logarithms.

- $\log_{10}(a / b) = \log_{10}(a) - \log_{10}(b)$:

The logarithm of a quotient is the difference of the logarithms.

- $\log_{10}(a^n) = n * \log_{10}(a)$:

The logarithm of a power is the exponent times the logarithm.

Mastering Common Logarithms: Your Essential Study Guide and Intervention Resource

Navigating the world of logarithms can feel a bit like deciphering a secret code. You might encounter them in algebra, pre-calculus, or even science classes, and suddenly, you're staring at expressions with "log" and a bunch of numbers. If you've found yourself grappling with common logarithms, you're not alone! This comprehensive study guide and intervention resource is designed to demystify common logarithms, providing you with the knowledge and practice you need to conquer them. We'll break down the concepts, explore

essential properties, and equip you with the tools to tackle common logarithm problems with confidence.

What Exactly Are Common Logarithms?

Before we dive into the "study guide and intervention" part, let's get a solid understanding of what a common logarithm actually is. In its simplest form, a logarithm is the *inverse operation* of exponentiation. Think of it like this: if exponentiation answers "what is this number raised to this power?", then logarithms answer "what power do I need to raise this base to, to get this number?".

The term "common logarithm" specifically refers to a logarithm with a base of 10. This is why you'll often see it written as just " $\log(x)$ " without an explicitly stated base. The unspoken assumption is that the base is 10. So, when you see $\log(100)$, it's asking, "10 to what power equals 100?". The answer, of course, is 2, because $10^2 = 100$.

The Fundamental Relationship: Logarithms and Exponents

Understanding the relationship between logarithms and exponents is the absolute bedrock of mastering common logarithms. They are two sides of the same coin.

If you have an exponential equation in the form:

$$b^y = x$$

Then the equivalent logarithmic equation is:

$$\log_b(x) = y$$

For common logarithms, where the base 'b' is 10, this simplifies to:

$$10^y = x$$

is equivalent to

$$\log(x) = y$$

Example:

Exponential form: $10^3 = 1000$

Logarithmic form: $\log(1000) = 3$

This means that the logarithm of 1000 to the base 10 is 3. You can think of it as asking, "How many times do I need to multiply 10 by itself to get 1000?". The answer is three times.

Why Base 10? Historical and Practical Significance

You might wonder why base 10 is so "common." Historically, this base aligns with our decimal number system, making calculations and estimations more intuitive. Think about how we group numbers in tens, hundreds, thousands, and so on. This makes common logarithms incredibly useful in fields like:

1. **Chemistry:** Measuring pH, which is $-\log[H^+]$, the negative logarithm of the hydrogen ion concentration.
2. **Physics:** Measuring sound intensity (decibels) and earthquake magnitudes (Richter scale).
3. **Engineering:** Signal processing and data analysis.

Understanding the practical applications can make learning the abstract concepts much more engaging and provides context for why you're studying these mathematical tools.

Key Properties of Common Logarithms: Your Toolkit for Intervention

Just like any skill, mastering common logarithms involves learning and applying a set of fundamental properties. These properties are your "intervention tools" when faced with complex logarithmic expressions. Knowing these by heart will save you a lot of time and confusion.

1. The Logarithm of 1

For any base 'b' (and therefore for base 10), the logarithm of 1 is always 0.

$$\log_b(1) = 0$$

$$\log(1) = 0$$

Why? Because any number raised to the power of 0 equals 1 ($b^0 = 1$). So, $10^0 = 1$, which means $\log(1) = 0$.

2. The Logarithm of the Base

The logarithm of the base itself is always 1.

$$\log_b(b) = 1$$

$$\log(10) = 1$$

Why? Because the base raised to the power of 1 equals itself ($b^1 = b$). So, $10^1 = 10$, which means $\log(10) = 1$.

3. The Product Rule

The logarithm of a product is the sum of the logarithms of the factors.

$$\log_b(xy) = \log_b(x) + \log_b(y)$$

$$\log(xy) = \log(x) + \log(y)$$

Intervention Tip: If you see a logarithm of a number that can be easily factored (like $\log(200) = \log(2 * 100)$), you can break it down into simpler logs ($\log(2) + \log(100)$). This is crucial for simplifying expressions and solving equations.

4. The Quotient Rule

The logarithm of a quotient is the difference of the logarithms of the numerator and the denominator.

$$\log_b(x/y) = \log_b(x) - \log_b(y)$$

$$\log(x/y) = \log(x) - \log(y)$$

Intervention Tip: This rule is the opposite of the product rule in reverse. If you have a subtraction of logarithms ($\log(50) - \log(5)$), you can combine them into a single logarithm ($\log(50/5) = \log(10)$).

5. The Power Rule

The logarithm of a number raised to a power is that power multiplied by the logarithm of the number.

$$\log_b(x^n) = n * \log_b(x)$$

$$\log(x^n) = n * \log(x)$$

Intervention Tip: This is arguably one of the most powerful rules. It allows you to bring down exponents, which is essential for solving logarithmic equations where the variable is in the exponent. For example, $\log(100^2) = 2 * \log(100)$.

6. The Change of Base Formula

While we're focusing on common logarithms (base 10), sometimes you might encounter logarithms with different bases. The change of base formula allows you to convert any logarithm to a common logarithm (or a natural logarithm, base 'e').

$$\log_b(x) = \log_a(x) / \log_a(b)$$

Specifically, to convert to a common logarithm (base 10, represented by 'log'):

$$\log_b(x) = \log(x) / \log(b)$$

Intervention Tip: This is your go-to formula when your calculator only has "log" (base 10) and "ln" (base e) buttons, and you need to evaluate a logarithm with a different base, like $\log_2(8)$.

Common Logarithm Problems and Intervention Strategies

Now that you're armed with the fundamental properties, let's tackle some common problem types and discuss effective intervention strategies.

Type 1: Evaluating Simple Logarithms

These problems involve finding the value of a common logarithm directly, often without a calculator.

Example: $\log(10000)$

Intervention Strategy: Ask yourself, "10 to what power equals 10000?". Since $10^4 = 10000$, $\log(10000) = 4$.

Example: $\log(0.01)$

Intervention Strategy: Rewrite 0.01 as a power of 10. $0.01 = 1/100 = 10^{-2}$. Therefore, $\log(0.01) = -2$.

Type 2: Expanding and Condensing Logarithmic Expressions

These problems test your understanding of the product, quotient, and power rules.

Expanding: "Expand $\log(x^2/y^3)$ "

Intervention Strategy: Apply the rules in reverse. First, use the

quotient rule: $\log(x^2) - \log(y^3)$. Then, use the power rule: $2*\log(x) - 3*\log(y)$.

Condensing: "Condense $2*\log(a) + \log(b) - \log(c)$ "

Intervention Strategy: Work from left to right or apply rules strategically. Use the power rule first: $\log(a^2) + \log(b) - \log(c)$. Then, use the product rule: $\log(a^2 * b) - \log(c)$. Finally, use the quotient rule: $\log((a^2 * b) / c)$.

Type 3: Solving Logarithmic Equations

These are often the most challenging, as they require a combination of properties and algebraic manipulation.

Example: $\log(x + 1) = 2$

Intervention Strategy: Convert the logarithmic equation to its exponential form. Since $\log(x + 1) = 2$ is base 10, the equivalent exponential form is $10^2 = x + 1$. So, $100 = x + 1$. Solving for x gives $x = 99$.

Example: $\log(x) + \log(x - 3) = 1$

Intervention Strategy: First, condense the left side using the product rule: $\log(x * (x - 3)) = 1$. Then, convert to exponential form: $10^1 = x(x - 3)$. This gives $10 = x^2 - 3x$. Rearrange into a quadratic equation: $x^2 - 3x - 10 = 0$. Factor the quadratic: $(x - 5)(x + 2) = 0$. The possible solutions are $x = 5$ and $x = -2$. **Crucially, remember to check for extraneous solutions.** Since the argument of a logarithm must be positive, $\log(x)$ is undefined for $x = -2$. Therefore, the only valid solution is $x = 5$.

Example: $3^x = 15$

Intervention Strategy: This is where taking the logarithm of both sides is essential. Take the common logarithm of both sides: $\log(3^x) = \log(15)$. Use the power rule to bring down the exponent: $x * \log(3) = \log(15)$. Isolate x by dividing: $x = \log(15) / \log(3)$. You would then use a calculator to find the approximate numerical value.

Utilizing Your Calculator for Common Logarithms

While understanding the theory is paramount, calculators are invaluable tools for evaluating common logarithms, especially when dealing with non-integer answers or complex numbers. Familiarize yourself with the "log" button on your calculator. It typically computes the common logarithm (base 10).

Approximation and Exact Values

For problems that require a numerical answer, your calculator will provide an approximation. However, in many academic settings, leaving answers in terms of logarithms (e.g., $\log(7)$) is considered an "exact value" and is preferred unless a decimal approximation is specifically requested.

Common Pitfalls and How to Avoid

Them

Even with a solid understanding, certain mistakes are common when working with logarithms. Here are a few to watch out for:

1. **Confusing $\log(x+y)$ with $\log(x) + \log(y)$:** Remember, the logarithm of a sum is NOT the sum of the logarithms. This is a very frequent error.
2. **Forgetting the domain of logarithms:** The argument of a logarithm (the number inside the parentheses) must always be positive. This is why checking for extraneous solutions in logarithmic equations is critical.
3. **Incorrectly applying the power rule:** Ensure you bring the entire exponent down as a multiplier.
4. **Mixing up log rules:** Double-check which rule applies when – product for addition, quotient for subtraction, and power for multiplication.

Questions & Answers About study guide and intervention common logarithms answers

No	Question	Answer
1	What's the fundamental difference between a common logarithm and any other type of logarithm?	The key difference is the base. Common logarithms are logarithms with a base of 10, often written as $\log(x)$ or $\log_{10}(x)$. Other logarithms have different bases, like 'e' for natural logarithms ($\ln(x)$).
2	Why do we even use common logarithms? Are they just a mathematical quirk?	Common logarithms are incredibly useful because base 10 is our number system's base. This makes them intuitive for understanding magnitudes, scientific notation, and scales like the Richter scale (earthquakes) and pH scale (acidity).
3	How do I solve an equation like $\log(x) = 2$ using a study guide?	To solve $\log(x) = 2$, you need to convert it to its exponential form. Since it's a common logarithm (base 10), the exponential form is $10^2 = x$. Therefore, $x = 100$.
4	What are the key properties of common logarithms that I should memorize for an intervention?	Essential properties include: $\log(1) = 0$, $\log(10) = 1$, $\log(a * b) = \log(a) + \log(b)$, $\log(a / b) = \log(a) - \log(b)$, and $\log(a^n) = n * \log(a)$. Understanding these is crucial for simplifying expressions.

5	My study guide mentions 'change of base formula' for common logarithms. When would I need that?	You'd use the change of base formula ($\log_b(x) = \log_c(x) / \log_c(b)$) when you need to calculate a logarithm with a base other than 10 or 'e' using a calculator that only has log (base 10) and ln (base e) buttons. For common logarithms, you'd typically convert to base 10 or 'e'.
6	How does a common logarithm help in understanding large numbers or scientific notation?	The common logarithm of a number tells you the power of 10 needed to reach that number. For example, $\log(1,000,000) = 6$, meaning $10^6 = 1,000,000$. This makes it easy to grasp the order of magnitude of very large or very small numbers.
7	What's a common mistake students make when working with common logarithm problems in their intervention?	A frequent error is forgetting that 'log(x)' implies a base of 10. Students might incorrectly assume a different base or struggle with the conversion to exponential form, leading to incorrect answers when solving equations.
8	Can you give a practical example of where common logarithms are applied outside of a math textbook?	Absolutely! The decibel scale for sound intensity and the pH scale for acidity are both based on common logarithms. They allow us to express a vast range of values in a more manageable way.

Mastering Common Logarithms: A Comprehensive Study Guide and Intervention with Answers

By [Your Name/Journalist Name]

Published: [Date]

Logarithms, particularly common logarithms, are a fundamental concept in mathematics with wide-ranging applications. From scientific calculations to financial modeling, understanding and

applying common logarithms is crucial for students and professionals alike. This comprehensive guide aims to demystify common logarithms, providing a detailed study framework, addressing common areas of difficulty, and offering clear, step-by-step solutions to practice problems. Whether you're struggling with the basic definition or tackling complex equation solving, this article is designed to be your go-to resource for intervention and mastery.

Understanding the Foundation: What are Common Logarithms?

At its core, a logarithm is the inverse operation of exponentiation. When we talk about common logarithms, we are specifically referring to logarithms with a base of 10. This is why they are often written without an explicit base, simply as " $\log(x)$ ". The expression " $\log(x)$ " is equivalent to " $\log_{10}(x)$ ".

The Logarithmic Definition: Bridging Exponents and Logarithms

The fundamental relationship between exponents and common logarithms can be expressed as follows:

If $10^y = x$, then $\log(x) = y$.

In simpler terms, the common logarithm of a number (x) is the exponent (y) to which 10 must be raised to produce that number. This definition is the bedrock of all subsequent logarithm operations. Understanding this inverse relationship is the first critical step in

mastering common logarithms.

Why Base 10? The Significance of Common Logarithms

The prevalence of base 10 in our number system (decimal system) makes common logarithms incredibly practical. They simplify calculations involving powers of 10 and are instrumental in fields like chemistry (pH scale), seismology (Richter scale), and acoustics (decibel scale), where magnitudes often span many orders of magnitude.

Key Terminology: Numerals, Exponents, and Arguments

1. **Base:** In common logarithms, the base is always 10.
2. **Argument (or Numerals):** This is the number whose logarithm is being taken (the 'x' in $\log(x)$).
3. **Logarithm (or Exponent):** This is the result of the logarithmic operation, representing the exponent to which the base must be raised (the 'y' in $\log(x)$).

Common Logarithm Examples: From Simple to Complex

1. $\log(100) = 2$, because $10^2 = 100$
2. $\log(1000) = 3$, because $10^3 = 1000$
3. $\log(1) = 0$, because $10^0 = 1$

4. $\log(0.1) = -1$, because $10^{-1} = 0.1$

Understanding these basic examples helps solidify the inverse relationship between exponentiation and common logarithms.

Study Guide: Key Concepts and Properties of Common Logarithms

Beyond the definition, a thorough understanding of common logarithms requires familiarity with their properties. These properties are essential for simplifying expressions and solving logarithmic equations. Let's explore them:

1. The Product Rule

The logarithm of a product is the sum of the logarithms of the factors.

$$\log(MN) = \log(M) + \log(N)$$

Example: $\log(100 * 1000) = \log(100) + \log(1000) = 2 + 3 = 5$. (Since $100 * 1000 = 100,000$, and $\log(100,000) = 5$)

2. The Quotient Rule

The logarithm of a quotient is the difference of the logarithms of the numerator and the denominator.

$$\log(M/N) = \log(M) - \log(N)$$

Example: $\log(1000 / 100) = \log(1000) - \log(100) = 3 - 2 = 1$. (Since $1000 / 100 = 10$, and $\log(10) = 1$)

3. The Power Rule

The logarithm of a number raised to an exponent is the exponent multiplied by the logarithm of the number.

$$\log(M^p) = p * \log(M)$$

Example: $\log(100^3) = 3 * \log(100) = 3 * 2 = 6$. (Since $100^3 = 1,000,000$, and $\log(1,000,000) = 6$)

4. The Change of Base Formula (for reference, though less critical for common logs)

While not directly used for common logs, it's worth noting the change of base formula, which allows conversion between different logarithm bases:

$$\log_b(x) = \log_a(x) / \log_a(b)$$

This means you can use common logarithms (base 10) or natural logarithms (base e) to calculate logarithms of any other base. For common logarithms, this means:

$$\log_{10}(x) = \log(x) / \log(10) = \log(x) / 1 = \log(x)$$

5. Logarithm of the Base

The logarithm of the base to itself is always 1.

$$\log(10) = 1 \text{ (because } 10^1 = 10)$$

6. Logarithm of 1

The logarithm of 1 for any base is always 0.

$\log(1) = 0$ (because $10^0 = 1$)

Using a Calculator for Common Logarithms

Most scientific calculators have a dedicated "log" button for common logarithms. Understanding how to use this button is crucial for evaluating logarithms of numbers that are not simple powers of 10. For instance, $\log(50)$ can be directly calculated using this button, yielding approximately 1.69897.

Intervention: Tackling Common Logarithm Problems

Many students find common logarithms challenging when they move beyond basic evaluation and into equation solving and simplification. This section provides intervention strategies and practice problems to address these difficulties.

Common Pitfalls and How to Avoid Them

1. **Confusing Logarithms with Exponents:** Always remember the inverse relationship: $\log_b(x) = y$ if and only if $b^y = x$.
2. **Incorrectly Applying Logarithm Properties:** Double-check the rules. For example, $\log(M + N)$ is NOT equal to $\log(M) + \log(N)$.

3. **Forgetting the Base:** While common logs often omit the base, remember it's 10. This is critical when converting between exponential and logarithmic forms.
4. **Domain Errors:** The argument of a logarithm (the number inside the log) must always be positive. $\log(x)$ is undefined for $x \leq 0$.

Solving Logarithmic Equations: Step-by-Step

Solving equations involving common logarithms often requires isolating the logarithmic term and then converting to exponential form, or using logarithm properties to combine terms.

Type 1: Equations of the form $\log(x) = c$

Strategy: Convert to exponential form.

Example: Solve $\log(x) = 3$

Step 1: Identify the base (10), the argument (x), and the logarithm (3).

Step 2: Convert to exponential form: $10^3 = x$

Step 3: Calculate: $x = 1000$

Check: $\log(1000) = 3$. Correct.

Type 2: Equations of the form $\log(\text{expression}) = c$

Strategy: Convert to exponential form.

Example: Solve $\log(2x + 1) = 2$

Step 1: Base = 10, Argument = $(2x + 1)$, Logarithm = 2.

Step 2: Convert: $10^2 = 2x + 1$

Step 3: Simplify: $100 = 2x + 1$

Step 4: Solve for x : $99 = 2x \Rightarrow x = 49.5$

Check: $\log(2 * 49.5 + 1) = \log(99 + 1) = \log(100) = 2$. Correct.

Type 3: Equations with logarithms on both sides

Strategy: Use logarithm properties to combine terms if necessary, or if $\log(A) = \log(B)$, then $A = B$.

Example: Solve $\log(x) + \log(x - 3) = 1$

Step 1: Use the product rule to combine the logarithms on the left side: $\log(x(x - 3)) = 1$

Step 2: Convert to exponential form: $x(x - 3) = 10^1$

Step 3: Simplify and solve the quadratic equation: $x^2 - 3x = 10 \Rightarrow x^2 - 3x - 10 = 0$

Step 4: Factor the quadratic: $(x - 5)(x + 2) = 0$

Step 5: Possible solutions: $x = 5$ or $x = -2$.

Check: Remember the domain of logarithms. $\log(x)$ requires $x > 0$, and $\log(x - 3)$ requires $x - 3 > 0$ (i.e., $x > 3$). Therefore, $x = -2$ is an extraneous solution. The only valid solution is $x = 5$.

Verification of $x = 5$: $\log(5) + \log(5 - 3) = \log(5) + \log(2)$. Using a calculator, $\log(5) \approx 0.69897$ and $\log(2) \approx 0.30103$. Their sum is approximately 1. Correct.

**Type 4: Equations involving logarithms of different bases
(requires change of base, less common for pure common log
problems but good to know)**

If you encounter a problem with mixed bases and need to solve it using common logarithms, you'd use the change of base formula to convert all logarithms to base 10.

Practice Problems and Answers: Reinforcing Understanding

The best way to solidify your understanding of common logarithms is through practice. Below are some problems covering various aspects of common logarithms, followed by detailed answers and explanations.

Section A: Basic Evaluation

1. $\log(10000)$
2. $\log(0.01)$
3. $\log(50)$
4. $\log(250)$

Section B: Applying Logarithm Properties

1. Simplify: $\log(2) + \log(5)$
2. Simplify: $\log(100) - \log(10)$
3. Simplify: $\log(x^4)$

4. Expand: $\log(a^2b^3/c)$

Section C: Solving Logarithmic Equations

1. Solve: $\log(x) = 4$
2. Solve: $\log(3x - 5) = 1$
3. Solve: $\log(x + 2) + \log(x - 1) = 1$
4. Solve: $2\log(x) = \log(9)$

Answers and Explanations

Section A: Basic Evaluation

1. $\log(10000)$

Explanation: We need to find the exponent 'y' such that $10^y = 10000$. Since $10^4 = 10000$, $\log(10000) = 4$.

2. $\log(0.01)$

Explanation: We need to find 'y' such that $10^y = 0.01$. Since $0.01 = 1/100 = 10^{-2}$, $\log(0.01) = -2$.

3. $\log(50)$

Explanation: This requires a calculator. $\log(50) \approx 1.69897$. This means $10^{1.69897} \approx 50$.

4. $\log(250)$

Explanation: Using a calculator, $\log(250) \approx 2.39794$. This means $10^{2.39794} \approx 250$.

Section B: Applying Logarithm Properties

1. Simplify: $\log(2) + \log(5)$

Explanation: Using the product rule, $\log(2) + \log(5) = \log(2 * 5) = \log(10)$. Since $\log(10) = 1$, the simplified form is 1.

2. Simplify: $\log(100) - \log(10)$

Explanation: Using the quotient rule, $\log(100) - \log(10) = \log(100 / 10) = \log(10)$. Since $\log(10) = 1$, the simplified form is 1.

3. Simplify: $\log(x^4)$

Explanation: Using the power rule, $\log(x^4) = 4 * \log(x)$.

4. Expand: $\log(a^2b^3/c)$

Explanation: Apply the quotient rule first: $\log(a^2b^3) - \log(c)$. Then apply the product rule to the first term: $\log(a^2) + \log(b^3) - \log(c)$. Finally, apply the power rule to the first two terms: $2\log(a) + 3\log(b) - \log(c)$.

Section C: Solving Logarithmic Equations

1. Solve: $\log(x) = 4$

Explanation: Convert to exponential form: $10^4 = x$. Therefore, $x = 10000$.

2. Solve: $\log(3x - 5) = 1$

Explanation: Convert to exponential form: $10^1 = 3x - 5$. So, $10 = 3x - 5$. Add 5 to both sides: $15 = 3x$. Divide by 3: $x = 5$. Check:

$\log(3 \cdot 5 - 5) = \log(15 - 5) = \log(10) = 1$. Correct.

3. Solve: $\log(x + 2) + \log(x - 1) = 1$

Explanation: Combine logs: $\log((x + 2)(x - 1)) = 1$. Convert to exponential form: $(x + 2)(x - 1) = 10^1$. Expand: $x^2 + x - 2 = 10$.

Rearrange into a quadratic: $x^2 + x - 12 = 0$. Factor: $(x + 4)(x - 3) = 0$. Possible solutions: $x = -4$ or $x = 3$. Check domain: $x + 2 > 0 \Rightarrow x > -2$. $x - 1 > 0 \Rightarrow x > 1$. Therefore, $x = -4$ is extraneous. The only valid solution is $x = 3$. Check: $\log(3 + 2) + \log(3 - 1) = \log(5) + \log(2) = \log(10) = 1$. Correct.

4. Solve: $2\log(x) = \log(9)$

Explanation: Use the power rule on the left side: $\log(x^2) = \log(9)$. Since the logarithms are equal, their arguments must be equal: $x^2 = 9$. Take the square root of both sides: $x = \pm 3$. Check domain: $\log(x)$ requires $x > 0$. Therefore, $x = -3$ is extraneous. The only valid solution is $x = 3$. Check: $2\log(3) = \log(3^2) = \log(9)$. Correct.
